True or False?
T F Informal Quiz 3
☐ ☐ The Nagle algorithm in TCP is intended to allow the ack and echo data to be combined.
☐ TCP is called "self-clocking" because the source sends a new packet into the network only upon receiving an ack.
☐ ☐ TCP by default uses a go-back-N retransmission policy
☐ ☐ A reason why fast-retransmit results in low throughput due to bursty drop is because it performs multiplicative decrease for each of the packets lost.
☐ ☐ TCP can control throughput & delay of a connection, and backs off during loss.
☐ ☐ The RFC 793 RTT estimator could only tolerate variances of upto 30%
☐ ☐ Anything slower than a multiplicative decrease and anything faster than a linear increase of congestion window can lead to instability.
☐ ☐ The slow-start exponential increase allows faster-than-linear increase and can work in general without congestion avoidance
☐ ☐ The persist timer is used by an ftp server to detect and close idle TCP connections
☐ ☐ Karn's algorithm would be triggered often on a wireless or radio link.
☐ ☐ Delayed-acks are good for interactive traffic, but bad for bulk traffic.

True or False?
т F Informal Quiz 3
\Box $\sqrt{}$ The Nagle algorithm in TCP allows the ack and echo data to be combined.
√ □ TCP is called "self-clocking" because the source sends a new packet into the network only upon receiving an ack.
$\sqrt{\Box}$ TCP by default uses a go-back-N retransmission policy
$\sqrt{\ }$ A reason why fast-retransmit results in low throughput due to bursty drop is because it performs multiplicative decrease for each of the packets lost.
\Box $\sqrt{\text{TCP}}$ can control throughput & delay of a connection, and backs off during loss.
$\sqrt{\ }$ The RFC 793 RTT estimator could only tolerate variances of upto 30%
√ □ Anything slower than a multiplicative decrease and anything faster than a linear increase of congestion window can lead to instability.
\Box \lor The slow-start exponential increase allows faster-than-linear increase and can work in general without congestion avoidance
\Box $$ The persist timer is used by an ftp server to detect and close idle TCP connections
$\sqrt{\Box}$ Karn's algorithm would be triggered often on a wireless or radio link.
$\sqrt{\Box}$ Delayed-acks are good for interactive traffic, but bad for bulk traffic.
