Informal Quiz 5

T  F

☐ ☐ A packet addressed to 225.13.40.3 will not leave the site (or administrative domain)

☐ ☐ SNMP is designed to fetch any subtree in a MIB in a single transaction

☐ ☐ The “SEQUENCE OF” constructor in ASN.1 syntax is used to define the equivalent of a “struct” in the C language.

☐ ☐ SNMP is only the message exchange protocol for network management.

☐ ☐ BOOTP extends RARP functionality and makes it independent of the link layer technology.

☐ ☐ The key difference between BOOTP and DHCP is that the latter can lease out addresses dynamically and for short periods.

Informal Quiz 5 (contd)

T  F

❑ ❑ Application-layer relays provide multicast-like efficiencies in packet transmission, but incur management overhead
❑ ❑ A unidirectional shared tree reaching all destinations in a group is sufficient to support IP multicasting to that group.
❑ ❑ An IP multicast routing tree is built and maintained using the combination of IGMP (at the leaves) and a routing protocol
❑ ❑ The MBONE is suitable for multiway, highly interactive videoconferences
❑ ❑ Scalability in multicast routing is typically achieved by using shared trees and not requiring off-tree state.
❑ ❑ Changing IP (to IPv6) requires change to both the lower (link) and higher (transport) layers.
Informal Quiz 5 (solns)

T  F
√ ☐ A packet addressed to 225.13.40.3 will not leave the site (or administrative domain)
☐ √ SNMP is designed to fetch any subtree in a MIB in a single transaction
☐ √ The “SEQUENCE OF” constructor in ASN.1 syntax is used to define the equivalent of a “struct” in the C language.
√ ☐ SNMP is only the message exchange protocol for network management.
√ ☐ BOOTP extends RARP functionality and makes it independent of the link layer technology.
√ ☐ The key difference between BOOTP and DHCP is that the latter can lease out addresses dynamically and for short periods
Informal Quiz 5 (contd)

T  F
√ □ Application-layer relays provide multicast-like efficiencies in packet transmission, but incur management overhead
□ √ A unidirectional shared tree reaching all destinations in a group is sufficient to support IP multicasting to that group.
√ □ An IP multicast routing tree is built and maintained using the combination of IGMP (at the leaves) and a routing protocol
□ √ The MBONE is suitable for multiway, highly interactive videoconferences
√ □ Scalability in multicast routing is typically achieved by using shared trees and not requiring off-tree state.
□ √ Changing IP (to IPv6) requires change to both the lower (link) and higher (transport) layers.
